PROFESSIONAL SUMMARY

Computer Science graduate (BSc, 2026) focused on IT infrastructure, networking and security. Hands-on with Linux, network analysis and static malware analysis, and builds tested, documented software in Python, C++, PHP and TypeScript. Thesis evaluated local LLMs for malware triage. Also built an LLM-powered IDE assistant solo at Veles Hack 2026.

EDUCATION

University of Western Macedonia, Kastoria, Greece 2021 – 2026

Bachelor of Computer Science

Relevant coursework: Network Security, Data Mining, Object-Oriented Programming, Databases, Distributed Systems, Digital Systems Design with VHDL

Certification: CompTIA Security+ (in progress)

TECHNICAL PROJECTS

Bachelor's Thesis: Local Large Language Models for Static Malware Triage (Python) GitHub 2026

An Evaluation Against Deterministic and Machine Learned Baselines

- Built a static analysis pipeline that extracts PE features (imports, sections, entropy, IOCs) with pefile and gets structured JSON threat assessments from a local LLM (llama3.2 via Ollama), compared against a heuristic score and Random Forest / Logistic Regression models (ROC AUC, bootstrap CIs). 74 tests.
- Findings: on a held-out set collected under pre-set rules, every method lost most of its performance and no LLM vs. baseline difference was shown, so the first dataset's results largely reflected how it was assembled.

Hyperion Agent (Python, FastAPI, LangChain): Veles Hack 2026 GitHub 2026

- LLM assistant for the HyperAI IDE that answers from project documents with hybrid RAG search and cited sources, and turns plain-language requests into validated file actions.
- Guardrails in code for off-topic and prompt-injection requests, path safety and confirmation before deletes. Passed all 37 end-to-end checks in my own testing.

Smart Shop: E-commerce & Forecasting (PHP, TypeScript, MySQL, Python) GitHub University Coursework · 2024 – 2025

- Framework-free online shop and admin dashboard: PHP 8 REST API (MVC, JWT, CSRF, Argon2id), TypeScript frontend and MySQL schema with ACID checkout transactions and row locks.
- Python service (pandas, scikit-learn) forecasts 7-day demand per product and flags stockout risk. 43 automated tests on GitHub Actions.

Municipal Request Management System (Python) GitHub University Coursework · 2023

- Citizen-to-technician system routing 4 request types to matching specialties, with a claim-based status pipeline (Sent → Received → Ongoing → Complete). 52 tests, cross-platform CI.

Euro ATM Simulator (C++17) GitHub University Coursework · 2022

- Simulated ATM with accounts, euro-note deposits and withdrawals, and an admin panel. Dynamic programming suggests note combinations from the notes on hand. 26 unit tests.

SKILLS

Security & Networking: Wireshark, Nmap, pefile

Systems: Linux (Kali, Arch, Ubuntu), Bash, SSH, WSL2, Git/GitHub

Programming Languages: Python, C, C++, Java, TypeScript, JavaScript, PHP, SQL (MySQL), HTML, CSS

AI & Data: LangChain, Ollama, RAG, scikit-learn, pandas

Cloud & Platforms: AWS

ADDITIONAL EXPERIENCE

Kitchen Staff, Fiamo Restaurant Victoria, BC, Canada · 2023 (6 months)

Coordinated with kitchen and front-house staff during high-volume service.

Warehouse Associate, Island Floors Victoria, BC, Canada · 2024 (6 months)

Managed inventory and stock tasks independently.

LANGUAGES

Greek (Native) · English (C1)
